$$\frac{(\sigma_1, \pi_1) \Rightarrow_{\mathcal{A}} \sigma_2 \qquad (\sigma_2, \pi_2) \Rightarrow_{\mathcal{A}} \sigma_3}{(\sigma_1, \pi_1; \pi_2) \Rightarrow_{\mathcal{A}} \sigma_3} \qquad \frac{(\sigma_1, \pi_1) \Rightarrow_{\mathcal{A}} \bot}{(\sigma_1, \pi_1; \pi_2) \Rightarrow_{\mathcal{A}} \bot}$$

$$\frac{(\sigma_1, \pi_1) \Rightarrow_{\mathcal{A}} \sigma_2 \qquad (\sigma_2, \pi_2) \Rightarrow_{\mathcal{A}} \bot}{(\sigma_1, \pi_1; \pi_2) \Rightarrow_{\mathcal{A}} \bot}$$

2 *Overture* CONSTRAINT TYPING

2.1 Constraint Satisfiability Modulo Finite Fields

$$\begin{array}{rcl} \phi & ::= & x \mid \phi + \phi \mid \phi - \phi \mid \phi * \phi \\ E & ::= & \phi \equiv \phi \mid E \wedge E \end{array}$$

We write $E_1 \models E_2$ iff every model of E_1 is a model of E_2. Note that this relation is reflexive and transitive.

$$\lfloor x \rfloor = x \qquad \lfloor \varepsilon_1 + \varepsilon_2\texttt{@}\iota \rfloor = \lfloor \varepsilon_2\texttt{@}\iota \rfloor + \lfloor \varepsilon_1\texttt{@}\iota \rfloor \qquad \lfloor \varepsilon_1 - \varepsilon_2\texttt{@}\iota \rfloor = \lfloor \varepsilon_2\texttt{@}\iota \rfloor - \lfloor \varepsilon_1\texttt{@}\iota \rfloor$$

$$\lfloor \varepsilon_1 * \varepsilon_2\texttt{@}\iota \rfloor = \lfloor \varepsilon_2\texttt{@}\iota \rfloor * \lfloor \varepsilon_1\texttt{@}\iota \rfloor$$

$$\lfloor \mathtt{OT}(\varepsilon_1 @ \iota_1, \varepsilon_2, \varepsilon_3) @ \iota_2 \rfloor = (\lfloor \varepsilon_1 @ \iota_1 \rfloor \wedge \lfloor \varepsilon_3 @ \iota_2 \rfloor) \vee (\neg \lfloor \varepsilon_1 @ \iota_1 \rfloor \wedge \lfloor \varepsilon_2 @ \iota_2 \rfloor)$$

$$\lfloor x := \varepsilon @ \iota \rfloor = x \equiv \lfloor \varepsilon @ \iota \rfloor \qquad \lfloor \mathtt{assert}(\varepsilon_1 = \varepsilon_2)\iota \rfloor = \lfloor \varepsilon_1 @ \iota \rfloor \equiv \lfloor \varepsilon_2 @ \iota \rfloor \qquad \lfloor \pi_1 ; \pi_2 \rfloor = \lfloor \pi_1 \rfloor \wedge \lfloor \pi_2 \rfloor$$

The motivating idea is that we can interpret any protocol π as a set of equality constraints $\lfloor \pi \rfloor$ and use an SMT solver to verify properties relevant to correctness, confidentiality, and integrity. Further, we can leverage entailment relation is critical for efficiency– we can use annotations to obtain a weakened precondition for relevant properties. That is, given π, program annotations or other cues can be used to find a minimal E with $\lfloor \pi \rfloor \models E$ for verifying correctness and security.

2.1.1 *Example: Correctness of 3-Party Addition.*

$$\begin{array}{lcl}
\mathtt{m}[s1]@2 & := & (\mathtt{s}[1] - \mathtt{r}[\mathtt{local}] - \mathtt{r}[x])@1 \\
\mathtt{m}[s1]@3 & := & \mathtt{r}[x]@1 \\
\mathtt{m}[s2]@1 & := & (\mathtt{s}[2] - \mathtt{r}[\mathtt{local}] - \mathtt{r}[x])@2 \\
\mathtt{m}[s2]@3 & := & \mathtt{r}[x]@2 \\
\mathtt{m}[s3]@1 & := & (\mathtt{s}[3] - \mathtt{r}[\mathtt{local}] - \mathtt{r}[x])@3 \\
\mathtt{m}[s3]@2 & := & \mathtt{r}[x]@3 \\
\mathtt{p}[1] & := & (\mathtt{r}[\mathtt{local}] + \mathtt{m}[s2] + \mathtt{m}[s3])@1 \\
\mathtt{p}[2] & := & (\mathtt{m}[s1] + \mathtt{r}[\mathtt{local}] + \mathtt{m}[s3])@2 \\
\mathtt{p}[3] & := & (\mathtt{m}[s1] + \mathtt{m}[s2] + \mathtt{r}[\mathtt{local}])@3 \\
\mathtt{out}@1 & := & (\mathtt{p}[1] + \mathtt{p}[2] + \mathtt{p}[3])@1 \\
\mathtt{out}@2 & := & (\mathtt{p}[1] + \mathtt{p}[2] + \mathtt{p}[3])@2 \\
\mathtt{out}@3 & := & (\mathtt{p}[1] + \mathtt{p}[2] + \mathtt{p}[3])@3
\end{array}$$

Letting π be this protocol, we can verify correctness as:

$$\lfloor \pi \rfloor \models \mathtt{out}@3 \equiv \mathtt{s}[1]@1 + \mathtt{s}[2]@2 + \mathtt{s}[3]@3$$

2.2 Confidentiality Types

$$\begin{array}{lcl}
t & ::= & x \mid c(x, T) \\
T & \in & 2^t \\
\Gamma & ::= & \varnothing \mid \Gamma ; x : T
\end{array}$$

Definition 2.1. $R_1 ; R_2 = R_1 \cup R_2$ iff $R_1 \cap R_2 = \varnothing$.

$$\textsc{DepTy}\quad \varnothing, E \vdash \phi : \mathit{vars}(\phi) \qquad\qquad \textsc{Encode}\quad \frac{E \models \phi \equiv \phi' \oplus \mathtt{r}[w]@\iota \qquad \oplus \in \{+, -\} \qquad R, E \vdash \phi' : T}{R ; \{\mathtt{r}[w]@\iota\}, E \vdash \phi : \{c(\mathtt{r}[w]@\iota, T)\}}$$

$$\textsc{Send}\quad \frac{R, E \vdash \phi : T}{R, E \vdash x \equiv \phi : (x : T)} \qquad\qquad \textsc{Seq}\quad \frac{R_1, E \vdash \phi_1 : \Gamma_1 \qquad R_2, E \vdash \phi_2 : \Gamma_2}{R_1 ; R_2, E \vdash \phi_1 \wedge \phi_2 : \Gamma_1 ; \Gamma_2}$$

Definition 2.2. Given preprocessing predicate E_{pre} and protocol π we say $R, E \vdash E_{pre} \wedge \lfloor \pi \rfloor : \Gamma$ is *valid* iff it is derivable and $E_{pre} \wedge \lfloor \pi \rfloor \models E$.

$$\frac{\iota \in C}{\Gamma, C \vdash_{leak} \Gamma(\mathtt{m}[w]@\iota)} \qquad \frac{\Gamma, C \vdash_{leak} T_1 \cup T_2}{\Gamma, C \vdash_{leak} T_1} \qquad \frac{\Gamma, C \vdash_{leak} \{\mathtt{m}[w]@\iota\}}{\Gamma, C \vdash_{leak} \Gamma(\mathtt{m}[w]@\iota)}$$

$$\frac{\Gamma, C \vdash_{leak} \{\mathtt{r}[w]@\iota\} \qquad \Gamma, C \vdash_{leak} \{c(\mathtt{r}[w]@\iota, T)\}}{\Gamma, C \vdash_{leak} T}$$

Theorem 2.3. *If $R, E \vdash E_{pre} \wedge \lfloor \pi \rfloor : \Gamma$ is valid and there exists no H, C and $\mathtt{s}[w]@\iota$ for $\iota \in H$ with $\Gamma, C \vdash_{leak} \{\mathtt{s}[w]@\iota\}$, then π satisfies gradual release.*

2.2.1 Examples.

```
m[s1]@2 := (s[1] - r[local] - r[x])@1
m[s1]@3 := r[x]@1

// m[s1]@2 : { c(r[x]@1, { c(r[local]@1, {s[1]@1} ) }
// m[s1]@3 : { r[x]@1 }
m[x]@1 := s2(s[x],-r[x],r[x])@2

// m[x]@1 == s[x]@2 + -r[x]@2
// m[x]@1 : { c(r[x]@2, { s[x]@2 }) }

m[y]@1 := OT(s[y]@1,-r[y],r[y])@2

// m[y]@1 == s[y]@1 + -r[y]@2
// m[y]@1 : { c(r[y]@2, { s[y]@1 }) }
```

2.3 Integrity Types

$$\begin{array}{rcl} \varsigma & ::= & \text{High} \mid \text{Low} \\ I & ::= & \varsigma \mid \iota \mid I \sqcap I \\ \Gamma & ::= & \varnothing \mid \Gamma; x : I \end{array}$$

$$\textsc{Value}\ \ \Gamma, E \vdash_\iota v : \text{High} \qquad \textsc{Secret}\ \ \Gamma, E \vdash_\iota \mathtt{s}[w] : \iota \qquad \textsc{Rando}\ \ \Gamma, E \vdash_\iota \mathtt{r}[w] : \iota \qquad \textsc{Mesg}\ \ \Gamma, E \vdash_\iota \mathtt{m}[w] : \Gamma(\mathtt{m}[w]@\iota)$$

$$\textsc{PubM}\ \ \Gamma, E \vdash_\iota \mathtt{p}[w] : \Gamma(\mathtt{p}[w]) \qquad \textsc{Binop}\ \ \frac{\Gamma, E \vdash_\iota \varepsilon_1 : I_1 \qquad \Gamma, E \vdash_\iota \varepsilon_2 : I_2 \qquad \oplus \in \{+, -, *\}}{\Gamma, E \vdash_\iota \varepsilon_1 \oplus \varepsilon_2 : I_1 \sqcap I_2}$$

$$\textsc{Send}\ \ \frac{\Gamma, E \vdash_\iota \varepsilon : I}{\Gamma, E \vdash x := \varepsilon@\iota : \Gamma; x : \iota \sqcap I} \qquad \textsc{Seq}\ \ \frac{\Gamma_1, E \vdash \pi_1 : \Gamma_2 \qquad \Gamma_2, E \vdash \pi_2 : \Gamma_3}{\Gamma_1, E \vdash \pi_1; \pi_2 : \Gamma_3}$$

$$\text{MAC}\ \ \frac{E \models \lfloor \mathtt{assert}(\psi_{BDOZ}(w))@\iota \rfloor}{\Gamma, E \vdash \mathtt{assert}(\psi_{BDOZ}(w))@\iota : \Gamma; \mathtt{m}[ws]@\iota : \iota}$$

$$\psi_{BDOZ}(w) \triangleq \mathtt{m}[wm] = \mathtt{m}[wk] + (\mathtt{m}[\mathtt{delta}] * \mathtt{m}[ws])$$

$$[\![\varsigma]\!]_{H,C} = \varsigma \qquad \frac{\iota \in H}{[\![\iota]\!]_{H,C} = \mathrm{High}} \qquad \frac{\iota \in C}{[\![\iota]\!]_{H,C} = \mathrm{Low}} \qquad [\![I_1 \sqcap I_2]\!]_{H,C} = [\![I_1]\!]_{H,C} \wedge [\![I_2]\!]_{H,C}$$

Definition 2.4. Given H, C and pre-processing predicate E_{pre} defining M, define $init(E_{pre}) \triangleq \Gamma$ where for all $\mathtt{m}[w]@\iota \in M$ we have $\Gamma(\mathtt{m}[w]@\iota) = \iota$.

Definition 2.5. Given pre-processing predicate E_{pre} and protocol π, we say $init(E_{pre}), E \vdash \pi : \Gamma$ is *valid* iff it is derivable and $E_{pre} \wedge \lfloor \pi \rfloor \models E$.

Theorem 2.6. *Given pre-processing predicate E_{pre} and protocol π, if $init(E_{pre}), E \vdash \pi : \Gamma$ is valid and for all H, C and $x \in V_{H \rhd C}$ we have $[\![\Gamma(x)]\!]_{H,C} = \mathrm{High}$, then cheating is detectable in π.*

3 COMPOSITIONAL TYPE VERIFICATION IN *Prelude*

3.1 Syntax and Semantics

Note the redefinition of x impacts the definition of T, Γ, ϕ, and E.

$$\begin{array}{rcl}
